PARKS PHARMACY X COMPOUNDING

Parks Pharmacy understands healthcare and the trends that are resorting back to good ole' fashion pharmacy practices. With the high cost of drugs and various ways to maintain a healthy quality of life, we have decided to change the equation. The backbone of the business will remain traditional pharmacy. "But the introduction of compounding is an awesome opportunity to assist a broader pool of people who may be challenged with the high cost of drugs."

Throughout a woman's lifetime...

Restoring a natural balance – The Benefits of Bio-Identical HRT:

Osteoporosis, heart disease, endometriosis, PMS, premenopausal symptoms, weight gain, low libido, fibrocystic breasts - most women will experience these or other hormone-related problems. Today, millions of women concerned about aging must

decide whether or not to undergo synthetic hormone replacement therapy – and suffer its side effects and increased risks of cancer. As we consider the benefit to risk ratio, we must take into account new evidence and ongoing research about alternatives to traditional therapy. Women, do you have enough TIME? Call Parks Pharmacy today with your specific need. You can be assured that you will receive the best compounded product possible!

Facts About Compounding

A growing number of people have unique health needs that off-the-shelf prescription medicines cannot meet. For them, customized, compounded medications -- prescribed or ordered by licensed physicians or veterinarians and mixed safely by trained, licensed compounding pharmacists -- are the only way to better health. Compounding is in even greater demand for treating animals because of the relatively narrow selection of medicines that are manufactured by pharmaceutical companies.

Pharmacists are the only health care professionals that have studied chemical compatibilities and can prepare alternate dosage forms. In fact, each state requires that pharmacy schools must, as part of their core curriculum, instruct students on the compounding of pharmaceutical ingredients. Compounding pharmacies are licensed and regulated in the 50 states and the District of Columbia by their respective state boards of pharmacy.

Because every patient is different and has different needs, customized, compounded medications are a vital part of quality medical care.

The basis of the profession of pharmacy has always been the "triad," the patient-physician-pharmacist relationship. Through this relationship, patient needs are determined by a physician, who chooses a treatment regimen that may include a compounded medication. Physicians often prescribe compounded medications for reasons that include (but are not limited to) the following situations:

- When needed medications are discontinued by or generally unavailable from pharmaceutical companies, often because the medications are no longer profitable to manufacture;
- When the patient is allergic to certain preservatives, dyes or binders in available off-the-shelf medications;
- When treatment requires tailored dosage strengths for patients with unique needs (for example, an infant);
- When a pharmacist can combine several medications the patient is taking to increase compliance;
- When the patient cannot ingest the medication in its commercially available form and a pharmacist can prepare the medication in cream, liquid or other form that the patient can easily take; and
- When medications require flavor additives to make them more palatable for some patients, most often children.

Also, compounding is extremely important to the veterinary community, which often requires more flavors, dosages forms and dosage strengths than commercially available medications supply.
